

**Peak Palm Oil PLC** proposes to work within an environmental management plan to ensure that their planning, planting and land preparation be in compliance with this plan. The land characteristics are flat to undulating and or agricultural lands.

Water management is extremely important and will allow for better growth of the palms. We will use a series of drain and drain sizes to optimise the correct amount of water needed to best help the trees flourish.

Infrastructure and road building will help build community relations as well as expand the project and its awareness. We will have a commuting system in place which will allow us to successfully manoeuvre between plantations and mill as well as access to the main fairway.

Bridges will be an important part of the infrastructure and we will use felled trees where possible.
